

# CS23336-Introduction to Python Programming

Started on	Sunday, 17 November 2024, 9:24 PM
State	Finished
Completed on	Sunday, 17 November 2024, 9:44 PM
Time taken	19 mins 37 secs
Marks	10.00/10.00
Grade	<b>100.00</b> out of 100.00

## Question 1

Correct  
Mark 1.00 out of 1.00  
Flag question

### Question text

Balanced strings are those that have an equal quantity of 'L' and 'R' characters.

Given a balanced string s, split it in the maximum amount of balanced strings.

Return the maximum amount of split balanced strings.

Example 1:

Input:

RLRRLRLRL

Output:

4

Explanation: s can be split into "RL", "RRLL", "RL", "RL", each substring contains same number of 'L' and 'R'.

Example 2:

Input:

RLLLLRRRLR

Output:

3

Explanation: s can be split into "RL", "LLLR", "LR", each substring contains same number of 'L' and 'R'.

Example 3:

Input:

LLLLRRRR

Output:

1

Explanation: s can be split into "LLLLRRRR".

Constraints:

1 <= s.length <= 1000

s[i] is either 'L' or 'R'.

s is a balanced string.

For example:

Test	Result
<pre>print(BalancedStrings('RLRRLRLRL'))</pre>	4
<pre>print(BalancedStrings('RLLLLRRRLR'))</pre>	3

Answer:(penalty regime: 0 %)

Reset answer

```
1 def BalancedStrings(s):
2     b=0
3     c=0
4     for char in s:
5         if char=="L":
6             b+=1
7         else:
8             b-=1
```

```
8         if b==0:
10             c+=1
11         return c
```

Feedback

Test	Expected	Got
print(BalancedStrings('RLRLLRLRL'))	4	4
print(BalancedStrings('RLLLLRRRLR'))	3	3

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

Question 2

Correct  
Mark 1.00 out of 1.00  
 Flag question

Question text

Two string values S1, S2 are passed as the input. The program must print first N characters present in S1 which are also present in S2.

Input Format:

The first line contains S1.  
The second line contains S2.  
The third line contains N.

Output Format:

The first line contains the N characters present in S1 which are also present in S2.

Boundary Conditions:

2 <= N <= 10  
2 <= Length of S1, S2 <= 1000

Example Input/Output 1:

Input:

```
abcbde
cdefghbb
3
```

Output:

```
bcd
```

Note:

b occurs twice in common but must be printed only once.

Answer:(penalty regime: 0 %)

```
1 def fun(s1,s2,n):
2     res=[]
```

```
3     seen=set()
4     for char in s1:
5         if char in s2 and char not in seen:
6             res.append(char)
7             seen.add(char)
8         if len(res)==n:
9             break
10    return ''.join(res)
11 s1=input()
12 s2=input()
13 n=int(input())
14 print(fun(s1,s2,n))
```

Feedback

Correct  
Marks for this submission: 1.00/1.00.

Question 3

Correct  
Mark 1.00 out of 1.00

 Flag question

Question text

You are given an  $m \times n$  integer matrix `matrix` with the following two properties:

- Each row is sorted in non-decreasing order.
- The first integer of each row is greater than the last integer of the previous row.

Given an integer `target`, return `True` *if target is in matrix* or `False` *otherwise*.

You must write a solution in  $O(\log(m * n))$  time complexity.

Example 1:

**Input:** `matrix = [[1,3,5,7],[10,11,16,20],[23,30,34,60]]`, `target = 3`  
**Output:** `True`

Example 2:

**Input:** `matrix = [[1,3,5,7],[10,11,16,20],[23,30,34,60]]`, `target = 13`  
**Output:** `False`

For example:

Test	Result
<code>print(searchMatrix([[1,3,5,7],[10,11,16,20],[23,30,34,60]], 13))</code>	<code>False</code>
<code>print(searchMatrix([[1,3,5,7],[10,11,16,20],[23,30,34,60]], 3))</code>	<code>True</code>

Answer:(penalty regime: 0 %)

Reset answer

```
1 def searchMatrix(m,t):
2     if not m or not m[0]:
3         return False
4     r,c=len(m),len(m[0])
5     l,r=0,r*c-1
6     while l<=r:
7         mid=(l+r)//2
8         mid1=m[mid//c][mid%c]
9         if mid1==t:
10            return True
11        elif mid1<t:
12            l=mid+1
13        else:
14            r=mid-1
15    return False
16
```

Feedback

Test	Expected	Got
print(searchMatrix([[1,3,5,7],[10,11,16,20],[23,30,34,60]], 13))	False	False
print(searchMatrix([[1,3,5,7],[10,11,16,20],[23,30,34,60]], 3))	True	True

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 4

Correct

Mark 1.00 out of 1.00

 Flag question

Question text

Given an array `nums` containing `n` distinct numbers in the range `[0, n]`, return *the only number in the range that is missing from the array*.

Example 1:

**Input:** `nums = [3,0,1]`  
**Output:** `2`  
**Explanation:** `n = 3` since there are 3 numbers, so all numbers are in the range `[0,3]`. `2` is the missing number in the range since it does not appear in `nums`.

Example 2:

**Input:** `nums = [0,1]`  
**Output:** `2`  
**Explanation:** `n = 2` since there are 2 numbers, so all numbers are in the range `[0,2]`. `2` is the missing number in the range since it does not appear in `nums`.

Example 3:

**Input:** `nums = [9,6,4,2,3,5,7,0,1]`  
**Output:** `8`  
**Explanation:** `n = 9` since there are 9 numbers, so all numbers are in the range `[0,9]`. `8` is the missing number in the range since it does not appear in `nums`.

For example:

Test	Result
print(missingNumber([3,0,1]))	2
print(missingNumber([0,1]))	2

Answer:(penalty regime: 0 %)

Reset answer

```
1 def missingNumber(nums):
2     n=len(nums)
3     s=n*(n+1)//2
4     s1=sum(nums)
5     return s-s1
6
```

Feedback

Test	Expected	Got
print(missingNumber([3,0,1]))	2	2

```
print(missingNumber([0,1]))      2      2

print(missingNumber([9,6,4,2,3,5,7,0,1])) 8      8
```

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

### Question 5

Correct  
Mark 1.00 out of 1.00  
 Flag question

#### Question text

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element  $a[i]$  is a peak element if

$A[i-1] \leq A[i] \geq a[i+1]$  for middle elements.  $[0 < i < n-1]$

$A[i-1] \leq A[i]$  for last element  $[i=n-1]$

$A[i] \geq A[i+1]$  for first element  $[i=0]$

#### Input Format

The first line contains a single integer  $n$  , the length of  $A$  .  
The second line contains  $n$  space-separated integers, $A[i]$ .

#### Output Format

**Print** peak numbers separated by space.

#### Sample Input

```
5
8 9 10 2 6
```

#### Sample Output

```
10 6
```

For example:

Input	Result
-------	--------

4 12 3 6 8	12 8
---------------	------

Answer:(penalty regime: 0 %)

```
1 def find(n,arr):
2     peaks=[]
3     for i in range(n):
4         if i==0:
5             if n==1 or arr[i]>=arr[i+1]:
6                 peaks.append(arr[i])
7         elif i==n-1:
8             if arr[i]>=arr[i-1]:
9                 peaks.append(arr[i])
10        else:
11            if arr[i]>=arr[i-1] and arr[i]>=arr[i+1]:
12                peaks.append(arr[i])
13    return peaks
14 n=int(input())
15 arr=list(map(int,input().split()))
16 peaks=find(n,arr)
17 print(' '.join(map(str,peaks)))
```

#### Feedback

Input	Expected	Got
7 15 7 10 8 9 4 6	15 10 9 6	15 10 9 6
4 12 3 6 8	12 8	12 8

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

Question 6

Correct  
Mark 1.00 out of 1.00  
 Flag question

Question text

An list contains N numbers and you want to determine whether two of the numbers sum to a given number K. For example, if the input is 8, 4, 1, 6 and K is 10, the answer is yes (4 and 6). A number may be used twice.

Input Format

The first line contains a single integer n , the length of list  
The second line contains n space-separated integers, list[i].  
The third line contains integer k.

Output Format

Print Yes or No.

Sample Input

7  
0 1 2 4 6 5 3  
1

Sample Output

Yes

For example:

Input	Result
5 8 9 12 15 3 11	Yes
6 2 9 21 32 43 43 1 4	No

Answer:(penalty regime: 0 %)

```
1 def fun(n,ar,k):
2     seen=set()
3     for num in ar:
4         if (k-num) in seen:
5             return "Yes"
6         seen.add(num)
7     return "No"
8 n=int(input())
9 arr=list(map(int,input().split()))
10 k=int(input())
11 print(fun(n,arr,k))
```

Feedback

Input	Expected	Got
5 8 9 12 15 3 11	Yes	Yes
6 2 9 21 32 43 43 1 4	No	
6		

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

### Question 7

Correct  
Mark 1.00 out of 1.00

 Flag question

#### Question text

Given two Strings s1 and s2, remove all the characters from s1 which is present in s2.

#### Constraints

1<= string length <= 200

#### Sample Input 1

experience  
enc

#### Sample Output 1

xpri  
Answer:(penalty regime: 0 %)

```
1 def remove(s1,s2):
2     res=''.join([char for char in s1 if char not in s2])
3     return res
4 s1=input()
5 s2=input()
6 print(remove(s1,s2))
```

#### Feedback

enc		

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

### Question 8

Correct  
Mark 1.00 out of 1.00

 Flag question

#### Question text

Given an array of integers nums which is sorted in ascending order, and an integer target, write a function to search target in nums. If target exists, then return its index. Otherwise, return -1.

You must write an algorithm with  $O(\log n)$  runtime complexity.

Example 1:

Input: nums = [-1,0,3,5,9,12], target = 9  
Output: 4  
Explanation: 9 exists in nums and its index is 4

Example 2:

Input: nums = [-1,0,3,5,9,12], target = 2  
Output: -1  
Explanation: 2 does not exist in nums so return -1

Constraints:

- 1 <= nums.length <= 10<sup>4</sup>
- -10<sup>4</sup> < nums[i], target < 10<sup>4</sup>
- All the integers in nums are **unique**.
- nums is sorted in ascending order.

For example:

Test	Result
print(search([-1,0,3,5,9,12],9))	4

Answer:(penalty regime: 0 %)

Reset answer

```
1 def search(nums,target):
2     l,r=0,len(nums)-1
3     while l<=r:
4         m=l+(r-l)//2
5         if nums[m]==target:
6             return m
7         elif nums[m]<target:
8             l=m+1
9         else:
10            r=m-1
11    return -1
12
```

Feedback

Test	Expected	Got
print(search([-1,0,3,5,9,12],9))	4	4
print(search([-1,0,3,5,9,12],2))	-1	-1

Passed all tests!

Correct  
Marks for this submission: 1.00/1.00.

Question 9

Correct  
Mark 1.00 out of 1.00  
 Flag question

Question text

Write a Python program for binary search.

For example:

Input	Result
1,2,3,5,8 6	False
3,5,9,45,42 42	True

Answer:(penalty regime: 0 %)

```
1 def search(arr,t):
2     arr.sort()
3     l,r=0,len(arr)-1
```

```
4 - while l<=r:
5 -     m=(l+r)//2
6 -     if arr[m]==t:
7 -         return True
8 -     elif arr[m]<t:
9 -         l=m+1
10 -    else:
11 -        r=m-1
12 -    return False
13 arr=list(map(int,input().split(',')))
14 t=int(input())
15 print(search(arr,t))
```

Feedback

Input	Expected	Got
1,2,3,5,8 6	False	False
3,5,9,45,42 42	True	True
52,45,89,43,11 11	True	True

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 10

Correct

Mark 1.00 out of 1.00

 Flag question

Question text

String should contain only the words are not palindrome.

Sample Input 1

Malayalam is my mother tongue

Sample Output 1

is my mother tongue

Answer:(penalty regime: 0 %)

```
1 - def ispalindrome(word):
2 -     i=0
3 -     j=len(word)-1
4 -     while i<j:
5 -         if word[i]!=word[j]:
6 -             return False
7 -         i+=1
8 -         j-=1
9 -     return True
10 words=input().lower().split(' ')
11 for word in words:
12 -     if not ispalindrome(word):
13         print(word,end=' ')
14
```
